

# Portalis® Unveils Dual-Head System Support

You can now connect your dual-head computer system into the pro-xi Workstation Integrator, providing you the revolutionary ability to manage and monitor both displays on a single monitor.

When you look closely at the diagram below, you can see that inputs 1 and 2 as well as inputs 3 and 4 are dual-head systems. Your operators now have access to multiple, dual-head systems on a single monitor, giving them unprecedented and absolute control of their control room.

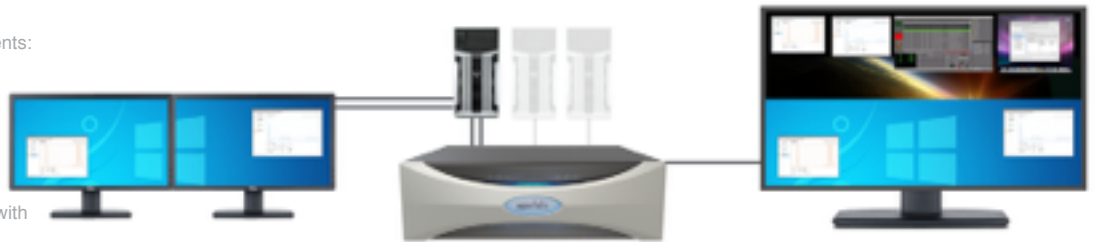

Many control rooms run dual-head systems requiring two monitors side by side. Now, for the first time in history, with the pro-xi technology, you can monitor and manage both inputs, from the same computer system, on a single display. Combined with Portalis' Dual-Screen capability, you can control both screens while still being able to switch back and forth to your other inputs instantly.

Protected by one or more of the following patents:
