Users Applaud Portalis' System Frame Unveiling

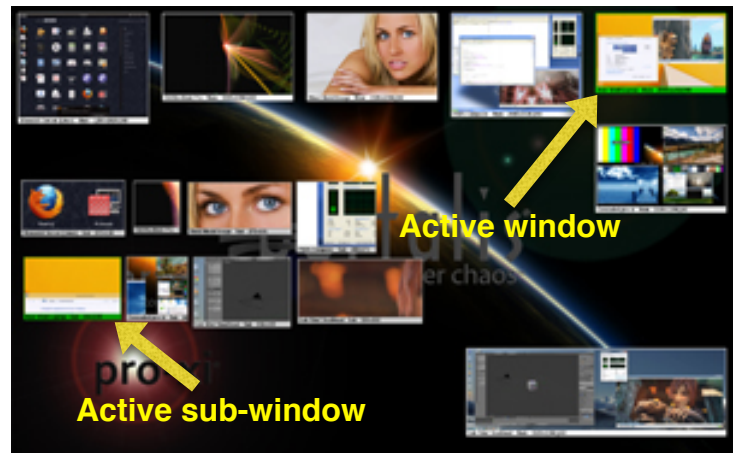

Customize on-screen System Information

Control Room managers deem the "on-screen information" in System Frames invaluable to managing dozens of systems simultaneously on one monitor. Operators can now instantly view each system's critical status, such as the name, output resolution, and display refresh rate, as well as other key data.

Instantly Determine Active Systems

Operators instantly identify the active or selected system and its corresponding Sub-Window using Frame Coloring. The frame color changes to indicate which computer system has been selected by the Operator (the dual-head system in this example).

When the operator activates a system, the frame color around the associated window (if any) changes to show the relationship.

Operators can quickly toggle the position of the frame information between the bottom of the frame ("under monitor display" or UMD) to the top of the frame ("over monitor display" or OMD).
