Portalis® Launches Virtual Control Rooms

NAB Las Vegas 2013: Multi-national corporations, world-wide broadcast enterprises, and global energy firms were amazed at the extraordinary pro-xi® technology introduced at NAB 2013.

Their engineers instantly recognized the unparalleled value in being able to simultaneously manage and monitor up to 64 disparate, computer systems on a single display, using one keyboard and one mouse.

In addition, technology directors and chief engineers were enthralled at finally being able to create Virtual Control Rooms and expand the management of systems outside the physical control room. By combining the power of the pro-xi *Workstation Integrator* with existing KVM infrastructure, operators can expand the command function to any monitor in any office in any building on the network.

Traditional Control Room

Work from any campus or office location

Work from home or any remote location

In addition to the extraordinary capability of managing multiple, disparate systems from one monitor, operators are able to create virtual control rooms by combining the power of the pro-xi Workstation Integrator with their existing KVM infrastructure.

"Wow, that's extraordinarily fast . . ."
— Engineer, 2013
